Kyoto University Institute for Advanced Study

Kyoto University Institute for Advanced Study

In the spirit of Kyoto University's tradition of academic freedom, KUIAS conducts advanced research utilizing the strengths of the University. Preeminent researchers from Japan and overseas gather at its international research centers.

As a leading institute of Kyoto University, KUIAS has a system in which researchers with excellent achievements and next-generation researchers can practice high-level research activities, no matter what field they are from.

Through high-level research activities, KUIAS contributes to nurturing young researchers, returning research benefits to society, and promoting science internationally.

Message from the President

President, Kyoto University
Nagahiro Minato

Since its establishment in 1897, under its guiding principle of academic freedom, the university has sought to contribute to harmonious coexistence in the global community through the cultivation of unique new knowledge. In 2017, Kyoto University was assigned by the Japanese government as one of Japan's first Designated National Universities (DNU). In accordance with its fundamental mission, the university seeks to contribute to humanity and society, and meet the constantly changing demands and needs of our times.

The Kyoto University Institute for Advanced Study (KUIAS) was established in April 2016 as a hub for the world's most advanced research. It comprises world-class research groups that include a Nobel laureate and a Fields Medalist, and two research centers established under the Japanese government's World Premier International Research Center (WPI) Initiative. It is a platform that gathers the skills and creativity of numerous talented researchers from within Japan and overseas. Recently, in collaboration with international partner institutions, the institute has been establishing "On-site Laboratories" at various locations around the world to further enhance its global research and education activities.

KUIAS aims gather the collected knowledge and wisdom of leading domestic and international scholars, cultivate the next generation of talented researchers, and, as an organization that drives university reform, promote innovative initiatives in both research and education, as well as university management and administration.

Message from the Director-General

Director-General, KUIAS
Shigefumi Mori

KUIAS is an institute that continuously conducts advanced research utilizing the strengths of Kyoto University. It features a team of excellent faculty members, including Distinguished Professors with internationally outstanding achievements in their respective fields, as well as various organizations engaged in world-leading research.

At present, KUIAS operates two World Premier International Research Center Initiative (WPI) centers: the Institute for the Advanced Study of Human Biology (ASHBi) since 2018, and the Institute for Integrated Cell-Material Sciences (iCeMS) since 2017. In addition, two collaborative research centers established in partnership with RIKEN and with Toyota Physical and Chemical Research Institute, as well as the Center for Integrative Medicine and Physics, a new endowed research laboratory founded in 2018, are undertaking cutting-edge research in their particular disciplines and combining their respective strengths to help accelerate the activities of KUIAS.

With these researchers and research centers at its core, KUIAS will contribute to academic progress as a global, cutting-edge research hub that draws together the knowledge of domestic and overseas researchers, fosters future scientific leaders, and shares the fruits of Kyoto University's research with society.

About KUIAS

■ Timeline

2016 Apr. 1	Kyoto University Institute for Advanced Study (KUIAS) is established Center for Advanced Study is established within KUIAS
2017 Apr. 1	Institute for Integrated Cell-Material Sciences (iCeMS) becomes a research center of KUIAS AIST-Kyoto University Chemical Energy Materials Open Innovation Laboratory (ChEM-OIL) joins KUIAS as a collaborative research center
2018 Jan. 1	Center for Integrative Medicine and Physics (iCeMS-CiMPhy) joins KUIAS as an endowed research section
2018 Mar. 1	RIKEN-Kyoto University Science, Technology and Innovation Hub (RIKEN-Kyoto U Hub) joins KUIAS as a collaborative research center
2018 Oct. 30	Institute for the Advanced Study of Human Biology (ASHBi) joins KUIAS as a research center
2022 Apr. 1	Toyota Riken-Kyoto University Research Center (TRiKUC) joins KUIAS as a collaborative research center

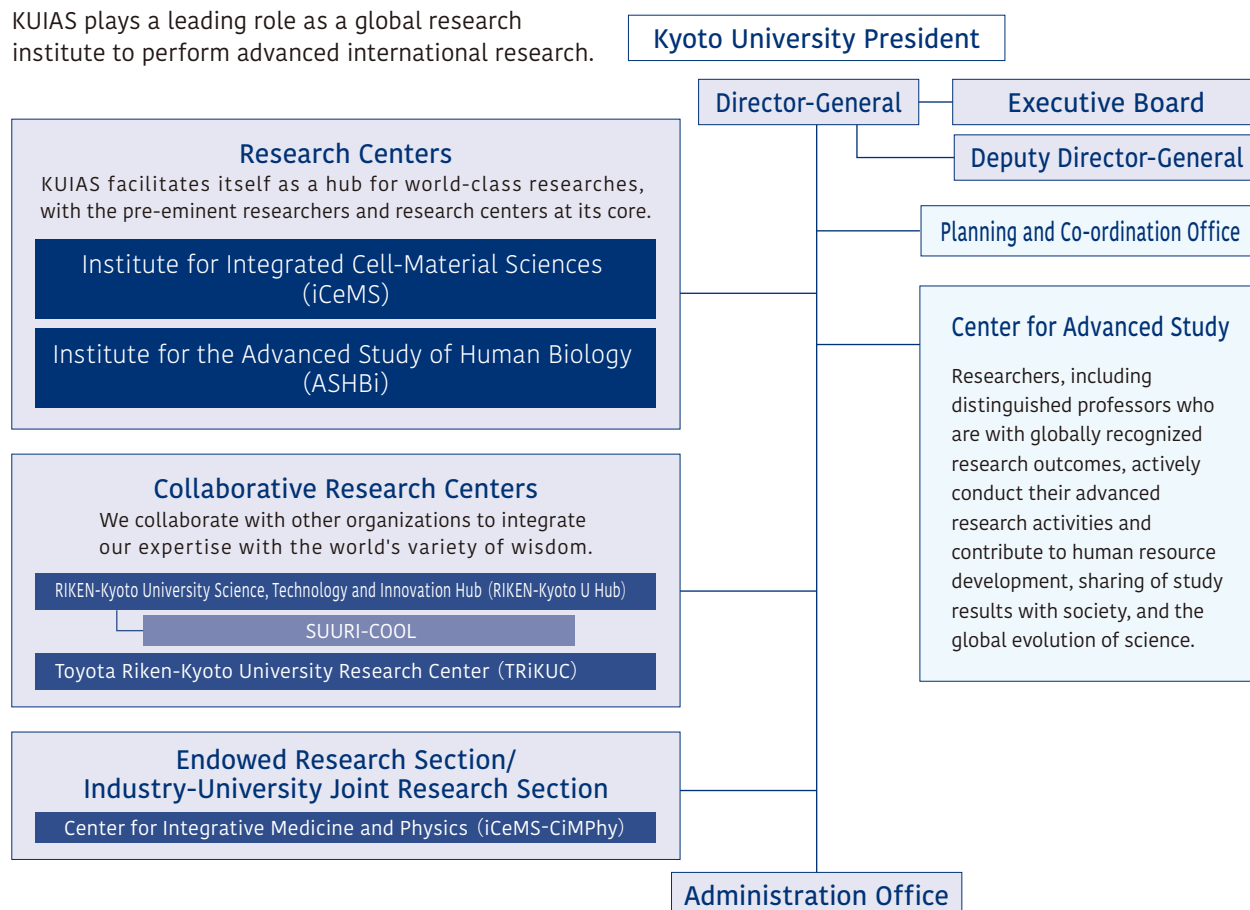

■ Features

KUIAS has the following features as an institute to grow into a leading center based on a new paradigm:

- Management with superb mobility under the strong leadership of the President
- Application of a pioneering organization system designed for a "special zone" within the university
System to allow world-leading excellent researchers to continue their research regardless of the conventional mandatory retirement age

■ Organizational Structure

KUIAS plays a leading role as a global research institute to perform advanced international research.

**Algebraic Geometry
Birational Geometry**

■ Biography

1973	B.Sc., Kyoto University
1975	M.Sc., Kyoto University
1978	Ph.D., Kyoto University
1975-1980	Assistant of Faculty of Science, Kyoto University
1980-1982	Lecturer of Faculty of Science, Nagoya University
1982-1987	Associate Professor of Faculty of Science, Nagoya University
1988-1990	Professor of Faculty of Science, Nagoya University
1990-2016	Professor of Research Institute for Mathematical Sciences, Kyoto University
2011-2014	Director of Research Institute for Mathematical Sciences, Kyoto University
2016-	Director-General and Distinguished Professor of KUIAS

| Research Overview |

Mori studies three-dimensional (3D) classification problems in a subfield known as birational classification theory of algebraic geometry. Algebraic geometry is a field in science that deals with shapes known as "algebraic varieties." Such an algebraic variety can appear in many slightly different forms if it is of dimension 2 (2D) or higher. The differences between these forms may be understood as partial dents or sharp points similar to those that appear in a physical object when it is struck by another. "Birational classification" refers to an approach where we ignore these minor differences when classifying algebraic varieties. It was known that one could make surfaces into minimal ones and minimize these differences by collapsing certain curves to points. This operation was known as the minimal model program (MMP).

For a long period of time, the generalization of the MMP to dimension three or higher was considered to be difficult; however, the introduction of extremal ray theory and application of general perspectives in [2] was a major trigger for the development of 3D MMP. Following this, MMP was developed, and it was discovered that in a broad sense, 3D birational classification theory is linked to the conjectural existence of an operation known as "flip." Furthermore, in [3], by proving the existence of 3D flips, the problem of 3D MMP was resolved. Hence, the 3D birational classification theory was completed in a rough sense. Subsequently, with the contribution of many researchers, MMPs of dimension four or higher have been established in a practical form.

■ Biography

1966	M.D., Kyoto University
1975	Ph.D., Kyoto University
1971-1973	Fellow of Carnegie Institution of Washington, Department of Embryology
1973-1974	Visiting Fellow and Associate of National Institute of Child Health and Human Development, NIH
1974-1979	Assistant Professor of Faculty of Medicine, The University of Tokyo
1979-1984	Professor of School of Medicine, Osaka University
1984-2005	Professor of Faculty of Medicine, Kyoto University
1996-2000	Director of Faculty of Medicine/Graduate School of Medicine, Kyoto University
2002-2004	Director of Faculty of Medicine/Graduate School of Medicine, Kyoto University
2005-	Specialty-Appointed Professor of Graduate School of Medicine, Kyoto University
2006-2017	Visiting Professor of Kyoto University
2006-2012	Executive Member of the Council for Science and Technology Policy, Cabinet Office
2012-2017	Chairman, Board of Directors, Shizuoka Prefectural University Corporation
2015-	President of Foundation for Biomedical Research and Innovation (2018- Kobe Biomedical Innovation Cluster)
2017-	Distinguished Professor of KUIAS
2018-	Deputy Director-General of KUIAS
2020-	Director of Center for Cancer Immunotherapy and Immunobiology (CCII), Graduate School of Medicine, Kyoto University

| Research Overview |

Honjo is well known for his discovery of activation-induced cytidine deaminase (AID) that is essential for class switch recombination and somatic hypermutation. He has established the basic conceptual framework of class switch recombination starting from discovery of DNA deletion (1978). Dr. Honjo identified a series of key molecules involved in immune regulation, including IL-4, IL-5, SDF-1, and IL-2R α chain. Also appreciated is his seminal contribution to developmental biology by identification of RBP-J as the Notch signaling target. In addition, he discovered PD-1 (program cell death 1), a negative coreceptor at the effector phase of immune response and demonstrated that PD-1 inhibition contributes to cancer treatments. Anti-PD-1 cancer immunotherapy has been approved in US, EU, and Japan. This treatment revolutionized the cancer therapy and is considered to be equivalent to penicillin in infectious diseases.

| Research Overview |

Kitagawa's main research field is inorganic and material chemistry, in particular, chemistry of coordination space, and his current research interests are centered on synthesis and properties of porous coordination polymers/metal-organic frameworks.

He was the first to discover and to demonstrate "porosity" for metal complexes with gas sorption experiments (1997), whose materials are called porous coordination polymers (PCPs) or metal-organic frameworks (MOFs). To date, MOFs are classified as a new category of porous materials, as opposed to the conventional classifications of inorganic and carbon materials. Kitagawa pioneered the functional chemistry of MOFs, and discovered flexible MOFs, dissimilar to those of conventional porous materials. Today several hundred different MOFs are known, and over 7,000 articles on this class of materials have been published annually worldwide. The research developments built on his discoveries are anticipated to lead to radical innovations in materials science, with wide-ranging implications for both academia and industry. Chemical industry firms are producing MOF materials for use in purification, storage, and transportation of gases, among other applications. Kitagawa's achievement has blazed a trail to a new era for porous materials, vital to addressing energy and environmental issues and contributing to human welfare.

iCeMS Director / Professor

Uesugi has been making ground-breaking discoveries in the field of chemical biology. As biological processes all stem from chemical events, it should be possible to understand or manipulate biological events by using chemistry. Uesugi and his co-workers have been discovering or designing unique organic molecules that modulate or interrogate fundamental processes in human cells. Such synthetic organic molecules often serve as tools for basic cell biology and for dissecting diseases. In particular, he has a special interest in combining chemical biology and material science concepts to open new avenues in cell biology and medical applications.

Saitou has been promoting studies on the developmental mechanisms of germ cells, the origin of all life. He clarified the formation mechanisms of mouse germ cells and successfully generated primordial germ cell-like cells (PGCLCs) in vitro from mouse ESCs and iPSCs to produce sperm, oocytes and healthy offspring. He used this experimental system as a model to investigate the molecular mechanisms of key phenomena in germ cell development, including epigenomic reprogramming, oocyte differentiation, and meiosis induction mechanisms. Saitou's analysis of the developmental mechanisms of cynomolgus monkeys has allowed us to identify the characteristics of pluripotent cell lineages in mice, monkeys and humans and the formation mechanisms of germ cells in primates. He has also generated PGCLCs and oogonium from human iPSCs and pioneered research on in vitro reconstitution in the process of human germ cell development.

Saitou aims to promote advanced human biology that develops these studies, to identify the characteristics and evolutionary mechanisms of humans and primates, and to lay out new possibilities in medical science.

Since early 70's, Kanade has performed a series of pioneering research in computer vision. The feature of his accomplishments is that they are fundamental in nature and have practical impacts. To illustrate a few, his neural network-based face detection technique raised the detection rate to an unprecedented level and thus led to today's common use of face detection in smart phone cameras; his optical-flow algorithm for estimating the direction and speed of moving patterns is now the basis of almost all the video processing including motion video coding; and his factorization algorithm for the so-called structure-from-motion problem was one of the earliest algorithms that demonstrated a successful reconstruction of three-dimensional shape from image sequence, which now is a powerful and common procedure for scene modeling by video. Kanade launched an autonomous vehicle project in 1985, and formed the early foundation for the recent emergence of autonomous driving technologies. The team developed one of the first artificial intelligence systems capable of sensing freeway lanes, executing accurate lane changes, recognizing and avoiding obstacles, and detecting other vehicles in real time based on data from vehicle-mounted range sensors and cameras. In 1995, he carried out a demonstration called No Hands Across America, in which the NAVLAB 5 vehicle drove from coast to coast, 98.2% under auto driving.

Dr. Kashiwara's work in Mathematics extends from microlocal analysis, representation theory and combinatorics to homological algebra, symplectic geometry and integrable systems. Most well-known works of him are his contributions to the theory of D-modules and his creation of crystal basis theory. Introduced by Sato around 1960, algebraic analysis is a framework in which systems of linear differential equations are formulated as modules over the ring D of differential operators and are investigated with algebraic means such as rings, modules, sheaves and categories. Sato's idea of D-modules was greatly developed by Kashiwara, and has become a fundamental tool in many branches of mathematics. In the 1980s with Schapira he further introduced and developed microlocal sheaf theory. One of his early major results was his 1980 construction of the Riemann-Hilbert correspondence, a generalization of Hilbert's 21st problem about the existence of a linear differential equation on the projective line with prescribed monodromy. The Riemann-Hilbert correspondence, found a remarkable application to a problem in representation theory, called the Kazhdan-Lusztig conjecture.

■ Biography

1971	M.Sci., Graduate School of Science, The University of Tokyo
1971-1974	Assistant, Research Institute for Mathematical Sciences, Kyoto University
1974-1977	Associate Professor, Nagoya University
1974	Ph.D., Kyoto University
1977-1978	Associate researcher, Massachusetts Institute of Technology
1978-1984	Associate Professor, Research Institute for Mathematical Sciences, Kyoto University
1984-2010	Professor, Research Institute for Mathematical Sciences, Kyoto University
2001-2003	Director of Research Institute for Mathematical Sciences, Kyoto University
2007-2009	Director of Research Institute for Mathematical Sciences, Kyoto University
2010-	Project Professor, Research Institute for Mathematical Sciences, Kyoto University
2019-	Program-Specific Professor, Kyoto University Institute for Advanced Study (KUIAS)

■ Honors

Iyanaga Prize of Mathematical Society of Japan (1981), Asahi Prize (1988), Japan Academy Prize (1988), Member of the Japan Academy (2007), Fujihara Award (2008), Chern Medal (2018), Kyoto Prize (2018), The Order of the Sacred Treasure, Gold and Silver Star (2020)

Yasuaki Hiraoka

Director of Center for Advanced Study /
Deputy Director of ASHBI / Professor

Topological Data Analysis,
Applied Mathematics

Hiraoka is a world leading mathematician in the area of topological data analysis (TDA). He studies mathematical theory and algorithms of TDA, and also works on applying them into scientific and engineering problems. His primary interest is to develop descriptors for characterizing shape of complex and big data. By combining various mathematical theories such as topology, representation, probability, he succeeded in making TDA powerful and general for practical problems. In applications, he has organized the materials TDA team, and his group achieved several pioneering results on structural analysis in materials science based on TDA. In particular, a series of methods developed by his group using persistent homology, machine learning, and inverse analysis are expected to be a key technology for materials informatics in future. In addition to materials science, he has recently launched TDA projects for other application areas such as life science.

■ Biography

- 2005 Doctor of Science, Graduate School of Engineering Science, Osaka University
- 2005-2006 JSPS PD, Research Institute for Electronic Science, Hokkaido University
- 2006-2009 Assistant Professor, Graduate School of Science, Hiroshima University
- 2009-2011 Associate Professor, Graduate School of Science, Hiroshima University
- 2009-2010 Visiting researcher, Department of Mathematics, University of Pennsylvania
- 2011-2015 Associate Professor, Institute of Mathematics for Industry (IMI), Kyushu University
- 2015-2016 Associate Professor, Advanced Institute for Materials Research (AIMR), Tohoku University
- 2016-2018 Professor, Advanced Institute for Materials Research (AIMR), Tohoku University
- 2017-2018 Team Leader, Center for Advanced Intelligence Project, RIKEN
- 2018- Director of Center for Advanced Study and Professor, Kyoto University Institute for Advanced Study (KUIAS)
- 2018- Deputy Director of Institute for the Advanced Study of Human Biology, Kyoto University Institute for Advanced Study (KUIAS)

■ Honors

JSIAM Best Paper Award (2004), The 1st Hiroshi Fujiwara Mathematical Science Award (2012), NISTEP Award (2016), JCS-Japan Award of the Outstanding Papers (2019)

Yasuhiro Murakawa

Professor

Human Genomics, Medicine, Life Science

More than 15 years have passed since the DNA sequence of the human genome, the general blueprint of the human being, was determined by an international research effort. However, "what is written in our human genome" is still largely unknown. Dr. Murakawa's team aims to understand the operating principles of our human genome that give rise to the dynamics of life, by combining classical biochemistry, cutting-edge high-throughput sequencing technology, and bioinformatics approach. We integrate multi-scale human data from the molecular level to the social level, and understand the fundamental mechanisms of our life, aging and death. We are also engaged in research with the aim of elucidating how diseases are caused and creating new future therapies. To this end, we hope to stay eccentric.

■ Biography

- 2008 M.D., Kyoto University
- 2008-2010 Resident, Kyoto University Hospital
- 2010-2015 DAAD fellow, Max-Delbrueck-Center for Molecular Medicine
- 2014 Ph.D., Free University of Berlin
- 2015-2019 Manager, RIKEN Preventive Medicine & Diagnosis (PMI)
- 2016-2018 Unit Leader, RIKEN Innovation Center (RInC)
- 2018- Team Leader, RIKEN Center for Integrative Medical Sciences (IMS)
- 2018- Group Leader, The FIRC Institute Molecular Oncology (IFOM)
- 2020- Professor, Kyoto University Institute for Advanced Study (KUIAS)

■ Honors

Kyoto University President's Award (2008)

Shinya Yamamoto

Associate Professor

Animal Behavior,
Comparative Cognitive Science

Yamamoto is studying the evolution of sociality and its related intelligence in humans and non-human animals, developing a two-by-two research paradigm: experiments and fieldwork with chimpanzees and bonobos. Recently he has been expanding this to some other animals such as dogs, cats, horses and elephants, both in captivity and in natural environments. His ultimate theme is to explore what humanity is. Where did it come from and how can it change in the future? He is especially interested in the evolution of social living characterized by empathy, cooperation, and culture. His previous work has revealed that chimpanzees help others upon request, but not proactively, even when they understand others' goals. This suggests that proactive helping is one of unique characteristics of humans. His main research sites are the Kumamoto Sanctuary (chimpanzees and bonobos), Wamba and Mbali/Malebo in DR Congo (wild bonobos), Bossou in Guinea (wild chimpanzees), horse-riding clubs and dog nurseries in Japan, Serra d'Arga in Portugal (feral horses), and Taiwan (free-ranging dogs).

■ Biography

- 2009 Ph.D. Science (Comparative Psychology), Graduate School of Science, Kyoto University
- 2009-2010 JSPS Post Doctoral Fellow (PD), Graduate School of Arts and Sciences, University of Tokyo
- 2010-2013 Program-specific Assistant Professor, Primate Research Institute, Kyoto University
- 2013-2017 Associate Professor, Graduate School of Intercultural Studies, Kobe University
- 2013-2017 Specially Appointed Associate Professor, Wildlife Research Center, Kyoto University
- 2017- Associate Professor, Kyoto University Institute for Advanced Study (KUIAS)
- 2017- Concurrent Associate Professor, Wildlife Research Center, Kyoto University

■ Honors

Takashima Award, Primate Society of Japan (2011), Award for Distinguished Early and Middle Career Contribution, Japanese Psychological Association's International Award (2015), Young Researcher Award, Kobe University President Award (2016), MEXT Young Scientists' Prize (2019)

Institute for Integrated Cell-Material Sciences (iCeMS)

iCeMS is committed to integrating materials science and cell biology to establish novel academic disciplines. Our mission is to explore the secrets of life by creating compounds to control cells, and further down the road to create life-inspired super materials.

Our approach is radical and new. At iCeMS we are not simply rewriting the rule-book, we are throwing it out of the window. Traditional single discipline-based research is not enough for nurturing flexible and innovative ideas. Thus at iCeMS biologists, chemists, engineers, physicists, and mathematicians share ideas and work together to devise new ways to integrate cells and materials, to keep creating new science.

iCeMS was established in 2007 as a center of the World Premier International Research Center Initiative (WPI) supported by Japan's ministry of science and has since fostered research excellence and promoted internationalization. In 2017, the institute was certified as a WPI Academy center for its level of research and management was recognized as the World Premier Status.

Motonari Uesugi
Director

■ Timeline

- | | |
|-----------|--|
| 2007 Sep. | iCeMS is selected for the World Premier International Research Center (WPI) Initiative by the Ministry of Education, Culture, Sports, Science and Technology (MEXT). |
| Oct. | iCeMS is established at Kyoto University with Prof. Norio Nakatsuji as founding director. |
| 2008 Jan. | The Center for iPS Cell Research and Application (CiRA) is established under the auspices of iCeMS with Prof. Shinya Yamanaka as founding director. |
| 2010 Apr. | The Center for iPS Cell Research and Application (CiRA) is re-established as a sister institute to iCeMS with Prof. Shinya Yamanaka as founding director. |
| 2012 Oct. | Prof. Shinya Yamanaka wins the Nobel Prize in Physiology or Medicine. |
| 2013 Jan. | Prof. Susumu Kitagawa succeeds Prof. Nakatsuji as director. |
| 2017 Apr. | iCeMS becomes a research center of KUIAS. |
| May. | iCeMS is certified as a WPI Academy center by MEXT. |
| 2023 Apr. | Prof. Motonari Uesugi succeeds Prof. Kitagawa as director. |

■ Principal Investigators (PIs) and Fellows

At iCeMS, researchers from different fields work together to devise groundbreaking ideas.

Institute for the Advanced Study of Human Biology (ASHBi)

ASHBi aims to establish an advanced study of human biology that sheds light on the origin and unique characteristics of human beings, by elucidating the design principles of human beings and disease states and by synthesizing this knowledge, using an interdisciplinary methodology that integrates multiple fields of study (life sciences, mathematics, humanities).

ASHBi was established in 2018 within the Kyoto University Institute for Advanced Study (KUIAS) as a new research center for the World Premier International Research Center Initiative (WPI) program of the Ministry of Education, Culture, Sports, Science and Technology (MEXT). ASHBi creates a highly open and flexible international research environment, and along with iCeMS, will be a world-leading international research center.

Mitinori Saitou
Director

■ Key Features of the Institute

- Research collaboration between biology and mathematics, and between biology and the humanities
- Core facilities with leading-edge technologies: Single-Cell Genome Information Analysis Core (SignAC), Primate Genome Engineering Core (PRiME) and Non-human Primate Phenotype Analysis Facility (NPAF)
- Prioritized support for overseas PIs and links with key international institutions (including EMBL, University of Cambridge, Karolinska Institutet)
- Strong links with the Kyoto University Hospital
- Prioritized support for early-career PIs linking with the University's researcher fostering projects.

■ Timeline

- | | |
|-----------|---|
| 2018 Oct. | ASHBi is selected by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) as a part of the World Premier International Research Center Initiative (WPI).
ASHBi is established within KUIAS.
ASHBi Satellite is established at the Shiga University of Medical Science. |
| 2019 Mar. | ASHBi Kick-off Symposium is held. |
| 2023 Feb. | ASHBi received "A" as the Interim Evaluation Score for the WPI Program. |

Collaborative Research Centers

RIKEN-Kyoto University Science, Technology and Innovation Hub (RIKEN-Kyoto U Hub)

Through collaboration between Kyoto University and RIKEN, this Hub aims to conduct joint research by using their respective potencies, extending the borders of their research organizational frameworks and study areas. It further strives to promote the world's most advanced research, leading to the development of new research horizons, and motivate next-generation researchers to advance its endeavors.

SUURI-COOL

The first collaborative center of the Hub, has recently been established within KUIAS. Its ultimate goal is to unravel the mysteries of the universe, matter and life, as well as address various key issues of modern society through its unique interdisciplinary approaches focusing on mathematics. We conduct researcher exchanges, joint research, and training of young researchers in various forms with the Graduate School of Science (human resource development in the mathematical sciences), KUIAS and the Graduate School of Science (medical science and mathematical science), the Graduate School of Advanced Integrated Studies in Human Survivability (social sciences), and the Research Institute for Mathematical Sciences (mathematics).

Toyota Riken-Kyoto U Research Center (TRiKUC)

TRiKUC was established on the Kyoto University main campus in April 2022 as a research center of collaboration between Kyoto University and Toyota Physical and Chemical Research Institute. TRiKUC conducts research on quantum materials, especially on superconductors, for the purpose of contributing to the progress of basic science, fostering the next generation of researchers, and disseminating research outcomes among the public.

Our research aims are (1) elucidation of unconventional superconducting states in the ruthenium oxide superconductor, (2) development of superconductors related to topological materials, and (3) exploration of novel properties emerging in quantum materials under uniaxial pressure. We tackle these topics through syntheses of new materials, growth of ultra-pure single crystals, and measurements of their physical properties down to temperatures below 1 kelvin.

Endowed Research Section / Industry-University Joint Research Section

Center for Integrative Medicine and Physics (iCeMS-CiMPhy)

This center has been established by the munificence of Nakatani Foundation for Advancement of Measuring Technologies in Biomedical Engineering with an objective to integrate physics and clinical medicine. The center aims to develop multiscale measurement/analysis platforms for the diagnosis of diseases and develop new technologies for the quantitative evaluation of the dynamics and collective order of cells. This center actively contributes to the society by implementing its newly developed measurement platforms (both hardware and software) and nurturing junior researchers with a global mindset.

3rd KUIAS-Heidelberg-RIKEN Joint Workshop "Medical Sciences and Mathematical Sciences" at Maskawa Hall (Left) and 25th Anniversary Symposium of German-Japanese Joint Research Project on Nonequilibrium Statistical Physics at Yukawa Institute for Theoretical Physics (Right)

Facilities

KUIAS Main Building

[Approx. 4,000m²]

The Main Building bears the headquarter functions of KUIAS. In addition to laboratories and collaborative research spaces, the building has a seminar hall, a lounge for informal gatherings of researchers, and an exhibition room which can also be used for meetings.

KUIAS West Building

[Approx. 550m²]

The West Building mainly serves as the laboratory and office of faculty members and researchers of the Center for Advanced Study.

To facilitate exchanges among researchers, the building is also equipped with shared spaces.

KUIAS iCeMS Research Building

Research Building No.1 / Project Lab
Research Building No.1 Annex

[Approx. 6,000m²]

In addition to laboratories for PIs, the building is equipped with the analysis center and common laboratories, as well as open office spaces and community spaces to advance cross-disciplinary research.

Faculty of Medicine Building B Institute for the Advanced Study of Human Biology

[Approx. 1,900m²]

In addition to laboratories for PIs, the building is equipped with the single-cell genome information analysis core and common laboratories, as well as open office spaces and community spaces to advance cross-disciplinary research.

Partner Institutions

KUIAS enriches its research through close contact with the following domestic and international partners.
